Mutat. 13:487-496(1999).

-1- FUNCTION: INVOLVED IN PEROXISOME BIOSYNTHESIS. REQUIRED FOR STABILITY OF THE PTSI RECEPTOR.

-1- SUBCELLULAR LOCATION: CYtOplasmic.
-1- DISEASE: DEFECTS IN PEX6 ARE THE CAUSE OF PEROXISOME BIOGENESIS DISONDER GROUP 4). PED ARE A GROUP OF LETHAL INHERITED DISEASES. THEY ARE CLINICALLY DIVIDED INTO FOUR GROUPS: ZELLWEGER SYNDROME (2S), NEORATAL ADRENOLEUKODYSTROPHY (NALD), INFANTILE REFSUM DISEASE (IRD), AND CLASSICAL RHIZOMELIC CHONDRONYSPRAIS AUGUSTAR (RCDP). ZS IS THE MOST SEVERE PHENOTYPE OF THE PED AND IS CHARACTERIZED BY THE ABSENCE OF PEROXISOMES AND BY MULTIPLE METABOLIC DEFECTS. PATIENTS WITH ZS HAVE SEVERE NEUROLGICAL ABNORMALITIES, DYSMORPHIC FACIAL FEATURES, HEPATOMEGALY, AND MULTIPLE RENAL CYSTS, MOST DIE WITHIN 6 MONTHS OF BIRTH. NALD AND IRD ARE SIMILAR TO 2S, BUT PROGRESSIVELY MILDER, WITH SOME IRD PATIENTS SURVIVING BEYOND THE THIRD DECADE OF LIFE. CLASSICAL RCDP, DISTINCT FROM THE ZS SPECTRRM, IS ASSOCIATED WITH A CHARACTERISTIC FACIAL APPEARANCE, RHIZOMELIA, CHARACTERISTIC FACIAL APPEARANCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A., AND VARIANTS ZS GLN-812 AND TRP-812.

Spong A.P., Subramani S.;

"Cloning and characterization of PAS5: a gene required for peroxisome biogenesis in the methylotrophic yeast Pichia pastoris.";

J. Cell Biol. 123:535-548(1993).

-!- FUNCTION: INVOLVED IN PEROXISOME BIOSYNTHESIS. NECESSARY FOR MATRIX PEROXISOMAL PROTEINS IMPORT. ESSENTIAL FOR GROWTH ON OLEIC ACID AND METHANOL AS SOLE CARBON SOURCE.

-!- SUBCELLULAR LOCATION: IT MAY BE ASSOCIATED WITH THE CYTOSKELETON OR IT MAY BE CYTOPLASMIC.

-!- SUBLAILY: BELONGS TO THE AAA FAMILY OF ATPASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     667 LRDTLQLPLQFPELFSQGLKPRSGVLLYGPP---GTGKTLLAKAVATELSLEFVSIKGPE 723

Juliary Significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22/21:4768-4778(1984)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, etg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the most uppermann initiation codon.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transcriptional regulator, len: 301 aa; previously transcriptional regulator, len: 301 aa; previously sequenced as TR:Q53869 (EMBL:U37580) S.coelicolor lysR-like protein (301 aa). Highly similar to SW.ARAB_STRAT (EMBL:U3783), araB, Streptomyces antibioticus transcriptional regulatory protein (301 aa), fasta soores; opt: 1581 z-score: 1813.2 E(::0, 80.3% identity in 300 aa overlap. Similar to many other transcriptional regulators. Contains probable helix-turn-helix motif at aa 17.38 (Score 1659, 44.84 SD). Contains Pfam match to PF00126 HTH_1, Bacterial regulatory helix-turn-helix protein, lysR family and PS00044
                                                                                         795 aa; unknown function, previously sequenced as TR:053870 (EMBL:U37580), S.coelicolor hypothetical protein ORF5 downstream of phosphotyrosine protein phosphatase (159 aa). Weak similarity to the N-terminus of TR:069888 (EMBL:AL023797) Streptomyces coelicolor hypothetical protein (172 aa), fasta scores; opt: 158 z-score: 206.4 E(): 0.00036, 46.2% identity in 65 aa overlap. gene

CDS

```
methionine gamma lyase (398 aa), fasta scores; opt: 608 z-score: 653.6 E(): 4.5e-29, 36.98 identity in 404 aa overlap. Highly similar to TR:053668 (EMBL:391393) streptomyces antibioticus hypothetical protein found upstream of the abaB gene (232 aa) (87.1% identity in 232 aa overlap). Contains Pfam match to PF01053 ac overlap. Cys_Met_metabolism plan match to AF01053 and PS00868 Cys_Met_metabolism plan-dependent enzyme attachment site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /translation="MSDSATTDSAGTGGERSASAPGDGTRAVRAGLPEPVKHEPTLPG

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     elongation factor; endodeoxyribonuclease; GTP pyrophosphokinase; membrane protein; membrane transferase; protein-export membrane protein; regulator; secreted protein; sugar transferase; threonine-tRNA synthetase; transport system inner membrane protein. Streptomyces coelicolor A3(2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bacteria; Firmicutes; Actinobacteria; Actinobacteridae;

jun/cg1-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg. grg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. If this cannot be the entire insert of the sequence MAY NOT be the entire insert of the sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /product="hypothetical protein SCL2.01"

The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.

Wholels Acids Research, 22(22):4768-4778(1994) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/

Jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon. Way be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlapp between neighbouring submissions.

Cosmid E19A lies between and overlaps cosmids E6 and E56 on the Asel-E genomic restriction fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /gene="SCE19A.01"

jun/cgi-bin/frameplot.pl. CAUTION: We may not have predicted the
correct initiation codon. Where possible we choose an initiation
codon (atg, gtg, ttg or (att)) which is preceded by an upstream
ribosome binding site sequence (optimally 5-13bp before the
initiation codon). If this cannot be identified we choose the most
upstream initiation codon. It may be the entire insert of the
sequenced clone. It may be shorter because we only sequence
overlapping sections once, or longer, because we arrange for a
small overlap between neighbouring submissions.
                                                                                                                                                                  3 (bases 1 to 32704)

Direct Submission
Submitted (03-AUG-2000) Streptomyces coelicolor sequencing project,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      note "nominal overlap with Streptomyces coelicolor cosmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markov Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacterial regulatory proteins, luxR family and match to rosite entry PSOG621 Bacterial regulatory proteins, luxR family signature. Also contains a possible helix-turn-helix motif at residues 699. 720 (+3.25 SD)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /gene="SCBAll.01"

correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream initiation codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bentley.S.D., Parkhill,J., Barrell,B.G. and Rajandream,M.A. Bentley.S.D., Parkhill,J., Barrell,B.G. and Rajandream,M.A. Direct Submitssion
